

Amendment to the Claims:

1. (Cancelled)

2. (Previously presented) The catheter as claimed in claim 7, wherein the dielectric material has a relative permittivity of less than 2.3.

3. (Previously presented) The catheter as claimed in claim 7, wherein the dielectric material is an aerated synthetic material.

4. (Currently amended) The catheter as claimed in claim 7, wherein the two electrical conductors conduct a direct voltage to [[the]] a voltage supply of a medical instrument arranged on or in the catheter.

5. (Previously presented) The catheter as claimed in claim 7, further including:

at least one active coil that facilitates catheter localization during an intervention.

6. (Previously presented) An MR device for forming MR images of an object to be examined, intended especially for intravascular interventional MR imaging, which device includes:

a main field magnet system for generating a homogeneous steady main magnetic field;

a gradient coil system for generating magnetic gradient fields;

an RF coil system for the exciting resonance in an examination zone;

a receiving coil system for receiving MR signals from the examination zone;

a catheter as claimed in claim 7 for introducing a medical instrument into the object to be examined, comprising an active coil which is arranged on or in the catheter for catheter localization, local excitation of the examination zone and/or local reception of MR signals; and

a control unit for controlling the MR device.

7. (Previously presented) A catheter that avoids heating of surrounding tissues by having a greater common mode frequency than the magnetic resonance frequency of a magnetic resonance imaging machine, the catheter comprising:

a catheter sleeve;

a hollow guide channel within the catheter sleeve that receives a medical instrument;

two electrical conductors enclosed by a cable sheath, the cable sheath comprising a dielectric material and the two electrical conductors serve for the transmission of RF signals within the catheter sleeve, the dielectric material having a relative permittivity smaller than 4, each of the two electrical conductors having a diameter between 5 and 50 μm , and the distance between the two electrical conductors being approximately 50 μm , such that the catheter avoids heating tissues surrounding the catheter.

8. (Currently amended) The catheter as claimed in claim [[1]] Z, wherein the dielectric material has a relative permittivity less than 1.5.

9. (Currently amended) The catheter as claimed in claim [[1]] Z, wherein the dielectric material has a relative permittivity less than 1.

10. (Currently amended) The catheter as claimed in claim [[1]] Z, wherein the diameter of each of the electrical conductors is approximately 15 μm .

11. (Previously presented) The MR device as claimed in claim 6 wherein the two electrical conductors and the dielectric material are configured such that a common mode resonance frequency of the active coil is shifted beyond a frequency of the MR signals.

12. (Previously presented) The MR device as claimed in claim 11 further including:

a position sensor coil array disposed adjacent the object for transmitting catheter positioning RF signals to the active coil for determining a position of the electrical conductors and the catheter, the position sensor coil array being in addition to the RF coil system and operating at different frequencies.

13. (Previously presented) The MR device as claimed in claim 12, wherein the positioning RF signals are at the common mode resonance frequency.

14. (Cancelled)

15. (Currently amended) The MR device as claimed in claim [[14]] 20 wherein the localization system includes:

~~an active coil defined by electrical conductors enclosed in a dielectric sheath,~~
the electrical conductors and the dielectric sheath being are configured to have a shortening factor such that a common mode frequency of the active coil is shifted from the imaging resonance frequency.

16. (Cancelled)

17. (Currently amended) The MR device as claimed in claim [[15]] 20 wherein the shortening factor is 1.2 or less.

18. (Cancelled)

19. (Currently amended) The MR device as claimed in claim [[15]] 20 wherein the dielectric sheath has a relative permittivity (ϵ_r) smaller than 2.3.

20. (Currently amended) ~~The An~~ MR device as claimed in claim 16 comprising:

a main field magnetic system which generates a main magnetic field in an examination zone;

a gradient coil system which creates magnetic field gradients across the examination zone;

an RF coil system which transmits RF excitation signals into the examination zone at an imaging resonance frequency to excite resonance in a region of an object in the examination zone;

a position sensor coil array disposed adjacent the examination zone, the position sensor coil array transmits RF positioning signals at a positioning frequency, the positioning frequency being shifted from the imaging resonance frequency;

a catheter configured to be inserted into the object, the catheter including:
an image acquisition coil disposed adjacent a tip of the catheter
and tuned to receive imaging resonance signals from resonance excited by the
RF coil system,

a localization system extending along the catheter, and tuned to
the positioning frequency such that heating adjacent to the catheter is
inhibited, the localization system including an active coil defined by electrical
conductors enclosed in a dielectric sheath,

wherein the positioning frequency is the common mode
frequency,

wherein the diameter of the electrical conductors is less than 50
μm and greater than 5 μm, and the spacing between the electrical conductors is
less than 300 μm, and

the dielectric sheath has a relative permittivity (ϵ_r) smaller than 4.

21. (Currently amended) A catheter [[that]] for a magnetic resonance
imaging machine that induces resonance with a characteristic magnetic resonance frequency,
the catheter minimizes the heating of surrounding tissues by having a greater common mode
frequency than [[a]] the characteristic magnetic resonance frequency of [[an]] the associated
magnetic resonance imaging machine, the catheter comprising:

a catheter sleeve made of a flexible material;

a hollow guide channel within the catheter sleeve that receives a medical
instrument;

two electrical conductors enclosed by a cable sheath, the cable sheath
including a dielectric material having a relative permittivity less than 4 and the two electrical
conductors serving to transmit RF signals within the catheter sleeve, each of the two
electrical conductors having a diameter between 10 to 30 μm and the two electrical
conductors configured to minimize a shortening factor of the catheter, and the distance
between the two electrical conductors being less than 200 μm, the electrical conductors being
configured to have a common mode frequency that is greater than a magnetic resonance
excitation frequency of the associated magnetic resonance imaging machine, such that during
a magnetic resonance imaging procedure, minimal heating of tissue surrounding the catheter
occurs.
